(laim 50; Fig 13; 239p; English.
The sequence given is encoded by the nucleotide sequence of human
Delta gene contained in plasmid cDNA clone Dil. A human expression
Library was constructed and screening assays were carried out on to
select for the expressed Delta product. Alternatively the sequences
could be isolated by amplification using polymerase chain reaction
(PCR) primers. The isolated gene may be inserted into a cloning
vector and expressed. The Delta gene and also the Notch and Serrate
neurogenic genes are designated 'toporythmic' genes. The proteins
they encode are involved in specific homo- or heterotypic interactions
crucial to differentiation. The quantitation of mRNA for human Notch
possible using the DNA and antibodies raised against the Notch and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

C-delta-1 polypeptide (W1119) is the chick homologue of Drosophila C-delta-1 polypeptide (W1119) is the chick homologue of Drosophila Delta, a protein that binds to Notch protein. Expression of C-delta-1 correlates with onset of neurogenesis. The C-delta-1 cannon acid sequence was deduced from a cDNA clone (T58897) obtd.

C rom chick stage 4-6 embryos. An alternatively spliced variant of From chick stage 4-6 embryos. An alternatively spliced variant of From 1979peptides have been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, and nervous system disorders or to Sequence 727 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               140 ddlttenperlisrlatgrhlavgeewsqdlhssgrtdlkysyrfvcdehyygegcsvfc 199

                                                                                                   C-Delta-1 correlates with onset of neurogenesis. The C-delta-1 amino acid sequence was deduced from a cDNA clone (T58898) obtd. from chick stage 4-6 embryos. A shorter version (W58877) of C-Delta-1, lacking the 12 C-terminal amino acids of the longer version, was also isolated, and mouse (W11720) and human (W11721-38) Delta-1 polyapptides have been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, and nervous system disorders or to promote tissue regeneration and repair.
                                                                                                                                                                                                                                                             N-PSDB; T58898.
New vertebrate Delta protein, DNA and antibodies -
                                                                                                                                                                                                                        Disclosure; Fig 2; 135pp; English.
C-delta-1 polypeptide (W00876) is the chick homologue of Drosophila Delta, a protein that binds to Notch protein. Expression of

                                                                                                                                                                                                                             Claim 4: Fig 8: 135pp; English.

M-delta-1 polypeptide (W11720) is the mouse homologue of Drosophila Delta-1 a protein that binds to Notch protein. It is expressed primarily in presomitic mesoderm, the central and peripheral nervous systems, and kidney. Chick (W11719) and human (W11721-38) Delta-1 polypeptides have also been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, as well as nervous system disorders, sequence 722 AA;

                                                      prevent malignancies characterised by increased Notch activity.

PS Claim 4; Page 95-98; 161pp; English.

CC Human Serrate-1 (W0583) and human Serrate-2 (W0583) are ligands

CC for the zygotic neurogenic locus Notch, and are believed to play a

CC major role in determining cell fates (differentiation) in the

CC central nervous system. Their amino acid sequences were deduced

CC from CDNA clones (see also T40090-91) isolated from human foetal

CC brain cDNA libraries. The proteins, antibodies raised to them,

CC and encoding nucleic acids can be used in the detection of

CS errate sequences and in the treatment of disorders of cell fate

CC and in tissue repair or regeneration

The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukamia and malignant tumours, and improvement of blood formation, e.g. after immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                itoh A, Sakano S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, e.g. after immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide(s) encoded by human genes delta-1 and serrate-1 - suppress proliferation and differentiation of undifferentiated human blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement cells, such as leukaemia and malignant tumours.
                                                                                                                                                                                                                                                                                                                                                                                                             Chick Serrate.

Disclosure; Page 112-115; 161pp; English.
Chicken Serrate (W05835), or C-Serrate, is a ligand for the zygo neurogenic locus Notch and is believed to play a major role in determining cell fates in the central nervous system. Its amino acid sequence was deduced from a cDNA clone (T40092) obtd. from optic explant cDNA library. C-Serrate is expressed in the central nervous system, cranial placodes, nephric mesoderm, vascular system, and limb bud mesenchyme.

```
The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, e.g. after immunosuppression.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

1:pir1 2:pir2 3:pir3 4:pir4 5:nr13d

Statistics: Mean 42.868; Variance 79.045; scale 0.542

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The neurogenic gene Delta of Drosophila melanogaster is
expressed in neurogenic territories and encodes a putative
transmembrane protein with EGF-like repeats.
                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Release 3.1A John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd

Run on: MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Fri Jun 12 12:04:53 1998; MasPar time 7.25 Seconds 795.610 Million cell updates/sec

Title:

Description: Perfect Score: Sequence: >US-08-083-590A-2 (1-230) from US08083590A.pep (2 of 2) 1734 1 MHWIKCLLTAFICFTVIVQV......ETGEIICLTGWQGDYCHIPK 230

Scoring table: : PAM 150 Gap 11

Searched: 69111 seqs, 25083644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swiss1

Statistics: Mean 44.483; Variance 66.618; scale 0.668

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
C -!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
C -!- TISSUE SPECIFICITY: APPEARS TO BE RESTRICTED EXCLUSIVELY I CELLS OF ECTODERMAL ORIGIN.
C -!- SEPARATION OF NEUROBLASTS FROM THE ECTODERM INTO THE INNER OF EMBRYO IS ONE OF THE FIRST STEPS OF CNS DEVELOPMENT IN THIS PROCESS IS UNDER CONTROL OF THE NEUROGENIC GENES.
-!- NOTCH AND SERRATE MAY INTERACT AT THE PROTEIN LEVEL, IT IS CONCELVABLE THAT THE SERRATE AND DELTA PROTEINS MAY COMPET FOR BINDING WITH THE NOTCH PROTEIN.
-!- SIMILARITY: CONTAINS 14 EGF-LIKE DOMAINS.

-!- TISSUE SPECIFICITY: FAI IS FOUND WITHIN THE STROMAL CELLS IN CLOSE CONTACT TO THE VASCULAR STRUCTURE OF PLACENTAL VILLI, YOLK SAC, FETAL LIVER, ADRENAL CORTEX AND PANCREAS AND IN THE BETA CELLS OF THE ISLETS OF LANGERHANS IN THE ADULT PANCREAS. FOUND ALSO IN SOME FORMS OF NEUROBODCRINE LUNG TUMOR TISSUE.
-!- PTM: N- AND O-GLYCOSYLATED.
-!- ALTERNATIVE PRODUCTS: AT LEAST ONE SHORTER PROTEIN IS DERIVED FROM THE SAME GENE BY ALTERNATIVE SPLICING.
-!- SIMILARITY: CONTAINS 6 EGF-LIKE DOMAINS.
